

Substitute Specification

ABSTRACT OF THE DISCLOSURE

The destemming device is installed on a harvesting machine, between the sloping end of the harvesting conveyors and the harvest collection bowls pertaining to the machine. The destemming device includes, upstream in the direction of the supply of the rough harvest, an extractor system for extracting the juice and the grapes detached from the stems by the crop package; and, downstream, a stemmer provided with an inlet that communicates with the sloping end of the extractor system. The stemmer enables the hacking of the bunches forming the remaining part of the harvest, and the rejection of the stems, plant waste and other undesirable products.
